

FITS FROM — Setup Guide

Domain, hosting, backend, and payments — what to click, what it costs, in order. Everything here is free except the domain (~\$9/yr).

1 · Cloudflare — hosting + domain (already half done)

The site already runs on Cloudflare Pages (free, unlimited bandwidth): fitsfrom.pages.dev. Two things left:

Buy the domain

1. dash.cloudflare.com → log in (same account the site deploys to).
2. Left sidebar → **Domain Registration** → **Register Domain**.
3. Search **fitsfrom.com** → add to cart → checkout (~\$9–10/yr, at-cost, no markup, free WHOIS privacy).

Connect it to the site

4. Sidebar → **Workers & Pages** → click the **fitsfrom** project.
5. **Custom domains** tab → **Set up a custom domain** → type fitsfrom.com → Confirm. DNS is automatic because the domain lives in the same account. Repeat for www.fitsfrom.com. Live in ~5 minutes.

Free analytics (optional, 2 min)

Sidebar → **Analytics & Logs** → **Web Analytics** → Add site → fitsfrom.com → paste the one script tag into index.html (or tell Claude to). Cookie-free, keeps the FAQ privacy promise honest.

2 · GitHub — back the code up (5 min, free)

In the terminal, run each line and follow prompts (choose GitHub.com → HTTPS → Login with browser):

```
gh auth login
```

Then tell Claude “push to github” — the repo TylerPark3/fitsfrom gets created and all commits pushed. After that, Cloudflare can auto-deploy on every push (Pages project → Settings → Source → connect GitHub).

3 · Supabase — accounts, live rooms, sync (free tier)

You do NOT need to pay. The free tier covers this app far past launch: 500 MB database, 50,000 monthly active users on auth, realtime included, 2 projects. You'd pay (\$25/mo) only after serious traction.

1. supabase.com → Start your project → sign in with GitHub.
2. New project → name: fitsfrom → generate a database password (save it in your password manager) → region: East US → Create.
3. Project Settings → API → copy two values: **Project URL** and **anon public key**. They are safe to put in frontend code.

4. Send both to Claude → wiring order: real accounts (Apple/Google sign-in) → live rooms (reactions/takes sync) → server-side unlock quota → cross-device wardrobe.

4 · Sovrn Commerce — links start earning (free)

1. sovrn.com/commerce → Sign up (site: fitsfrom.com, category: fashion content).
2. Approval is typically 1–2 days. Copy your **API key** from Settings.
3. Paste it into `src/lib/affiliate.ts` (one line) — every Buy link on the site starts paying 5–15% per sale. No deals to negotiate; attribution is automatic via the network's cookies. Add the one-line FTC disclosure to the FAQ (already drafted).

5 · Stripe — only when Pro launches (free until it earns)

Wait until the Supabase backend exists — a paywall without a server can be bypassed in DevTools. When ready:

1. stripe.com → create account (needs your SSN/bank — this part is you, not Claude).
2. Products → Add product → “Fits From Pro” → \$5/month recurring.
3. Create a **Payment Link** → copy URL → Claude wires the Pro button + webhook to Supabase. Stripe costs nothing monthly; they take 2.9% + 30¢ per charge.

Total monthly cost at launch

- Cloudflare Pages hosting — \$0
- fitsfrom.com domain — ~\$9/YEAR (the only real cost)
- Supabase free tier — \$0
- GitHub — \$0 · Sovrn — \$0 · Stripe — \$0 until it's earning
- Later, AI try-on/scan: pay-per-use API, roughly \$0.01–0.05 per image — gate it behind Pro so it pays for itself

Order of operations: domain → gh auth login → Sovrn application (it takes days, start early) → keep posting fits → Supabase when rooms need to be real → Stripe last.
